While peasants worldwide have united in social movements to fight land grabbing and protect their right to an adequate standard of living, including their right to food and right to land, the post-Soviet rural population, such as in Ukraine, has so far not expressed outright resistance to large-scale agricultural development, and the peasants’ rights discourse has been absent.

This article examines Ukrainian peasants’ responses to land grabs and agribusiness expansion. It discusses the post-Soviet context, forms of incorporation of the rural population in land deals, the lack of rural protests and mobilization, and the prospects for small-scale agriculture in the country.

LAND GRABBING AND THE ABSENCE OF PEASANT RESISTANCE

The World Bank recently included Ukraine in the list of resource-rich and finance-poor countries that have become targets for land grabbing. The country possesses more than 25% of the world’s richest and most fertile soil, ‘Black Earth’, and was the Soviet Union’s ‘breadbasket’. After the collapse of the Soviet Union in 1991, Ukraine undertook a land reform to break down the collective farms and distribute their lands to rural dwellers to help develop private farming. However, since all the other important factors (such as capital, know-how, upstream and downstream markets, and the rule of law) disappeared with the breakdown of the collectives, rural dwellers could not effectively use their land. Instead, land became concentrated: first in the hands of rural elites and later accumulated by large domestic and foreign investors that were motivated by the upswing in world food markets and the global land rush of the early 2000s. To date 60% of Ukrainian farmland is controlled by large agribusinesses, whose size and scale are comparable with the largest latifundia in Brazil and Argentina. The sale of agricultural land is prohibited in Ukraine until January 2016. Agribusinesses, therefore, rent land from the rural population (usually at unfavorable rates for the latter) or resort to illegal schemes to acquire land.

This expansion of land grabbing and agribusiness did not face outright resistance from the rural population. Instead, many rural Ukrainians rent out the distributed land to agribusinesses, while they cultivate tiny household plots (on average 0.4 hectares). Rural households only use 12% of Ukrainian farmland in total, but contribute...
to 52.7% of the gross domestic agricultural output. They produce 98% of the total harvest of potatoes, 86% of vegetables, 85% of fruits, and 81% of milk. The Ukrainian government largely overlooks the importance of population farming in its agricultural policy and instead supports agribusinesses. In 2012, 60% of all State subsidies to agriculture went to large businesses. Meanwhile, the rural population is on the brink of poverty with 44% having incomes below the subsistence minimum and 7% experiencing malnutrition.

The lack of open protest among the post-Soviet population is often explained by 70 years of socialism, during which expressions of disagreement with governmental actions were prosecuted, and serious protest led to being deported to work in the Gulag labor camp. The Ukrainian countryside is also currently experiencing an exodus of young and active residents who migrate to urban areas leaving behind the older population. Just over 24% of rural Ukrainians are over 60. Nevertheless, while these are important factors, our analysis suggests that the main reasons for this ‘quietness’ are: (1) the continuity of a dual agrarian structure, and the absence of conditions for commercial family farming; (2) the partial inclusion of rural households in land deals and large-scale agricultural development; and (3) the adaptability of peasant farming allowing it to persist in a hostile environment.

**PEASANTS AND LARGE-SCALE AGRICULTURAL DEVELOPMENT**

The bifurcated ‘Soviet-like’ agrarian structure remained in Ukraine despite the post-socialist land distribution: former collectives have been gradually transformed into large agribusinesses, while rural dwellers continue subsistence farming with their household plots, albeit with fewer opportunities for wage-work. Land grabbing was carried out without the physical displacement of the rural population.

When the large companies arrived in the Ukrainian countryside in the 2000s, rural socio-economic conditions were deplorable. The de-collectivization process of the 1990s caused: (1) a 40% rate of rural unemployment; (2) the disappearance of formal and informal support to households (previously, households were allowed to use collective facilities, such as pastures, machinery, and input; and pilfering from collective fields was socially accepted); and (3) a deterioration in rural infrastructure, which was formally part of the collectives’ responsibilities.

The domestic and foreign agribusinesses revitalized large-scale agricultural production, converting Ukraine into one of the world’s leading agro-food exporters. The new agricultural operators not only took over the land, but also several social functions of the former collectives. Some functions are performed in order to prevent sabotage to agribusinesses’ fields. Other functions are required by Ukrainian land law, which does not allow companies to own agricultural land. Since agribusinesses have to rent the land from peasants, they partly incorporate the rural population into large-scale agricultural development. The rental agreements imply a small (in-kind) payment to the landowners with almost no termination or renegotiation options. However, these payments are an important additional income for many rural households.

The lack of small-scale farm development programs, widespread corruption, and power discrepancies discourage peasants from using the distributed land for commercial farming. Moreover, due to the socialist tradition of industrial farming, many rural Ukrainians regard themselves primarily as workers rather than landowners, and believe that the agricultural land should be cultivated collectively. These factors define the peasants’ preference for wage-jobs at agribusinesses rather

---

than establishing independent family farms. According to the FAO Farm Survey of 2005, 96% of Ukrainian villagers did not want to start individual farming; 20% of those surveyed had a job; and 26% desired an agricultural wage-job. Rural workers also benefit from additional services provided by their employers (e.g. discounted farm input and output, assistance with ploughing, etc.). Rural families with at least one member employed at agribusinesses have the lowest poverty risk.

However, not everyone is integrated into large-scale agricultural development. Rural unemployment remains high. In 2004, 10% of the working-age rural population was unemployed. A number of rural households also do not receive rent payments. These include those who did not receive land plots during the land distribution, i.e. rural teachers, medical staff, postal workers, and those who sold their land in the early 1990s. Furthermore, a small group of commercial family farmers have experienced severe difficulties from the large agribusiness expansion. Large agribusinesses control food markets, the value chain and farmland distribution, and also receive the majority of State subsidies. This leaves limited opportunities for family farmers to grow and succeed.

ADAPTATION AND PERSISTENCE OF PEASANT HOUSEHOLDS

The adaptability of rural households is the other factor explaining the lack of rural protests against land grabs and large-scale agricultural development. Peasants are able to adapt their agricultural production to ensure that it does not overlap with the interests of agribusiness. After the collapse of the Soviet Union, rural household production has more than doubled. Before peasants produced almost everything for their subsistence needs, including wheat and other crops. Nevertheless, with the agribusiness expansion, peasants had to change their production strategy. The agribusinesses are interested in export-oriented monocrop (primarily wheat, barley and maize) production and neglect labor and time-intensive and less profitable agriculture such as potatoes, vegetables, fruits, meat, and dairy. Peasants took over this market niche and intensified the production of related foods. Today rural households meet their families’ needs with these products and sell the surplus on domestic markets. This market segmentation contributes to a fragile coexistence of large-scale agriculture with peasant farming.

However, if the interests of peasants and agribusinesses collide, the latter resort to predator politics to eliminate their competitors. The current State program supporting the industrialization of milk and meat production attracted agribusiness to this sector at the expense of rural households. Rural households are unable to meet the recently introduced sanitary requirements for keeping and slaughtering animals, and the annual epidemics of swine flu have led to a mass slaughtering of pigs. Peasants see these moves as a war against them.

Furthermore, the system of organized peasant food markets is underdeveloped in Ukraine. The majority of potatoes, fruits and vegetables produced by peasants are sold at improvised markets or on the roadside. Dairy and meat products require certification and can only be sold at official market places that are inaccessible and unaffordable to many peasants, or must be collected by intermediaries or processing plants. The collectors’ procurement prices are very low, often below peasants’ production costs. The absence of efficient protection mechanisms for small-scale farmers and a highly monopolized and criminalized collection business (especially for milk) means that peasants are unable to bargain for a higher price. In 2012, many peasants decided to take action and protested against the low milk procurement prices in front of local administration offices in several Ukrainian regions. Nevertheless, protesters

Christina Plank is a Ph.D. candidate at the Institute of Political Sciences of the University of Vienna.

Special thanks to Natalia Mamonova (ISS), Antonio Onorati (Centro Internazionale Crocetta) and Stineke Oenema (ICCO) for their important contribution to the availability of a more diverse range of nutritious products on the market. This would protect both the rights of producers and consumers.

The introduction of the land market is once again at the top of the political agenda in Ukraine. To date, the moratorium—valid until January 2016—prohibits the sale and purchase of agricultural land. Yet the current government is already preparing the opening-up of the land market with the support of the EU, as highlighted in the article above. Since the privatization of farmland is an unpopular topic among the (rural) Ukrainian population, liberalization has already been postponed several times.

According to an opinion poll carried out by the Razumkov Centre in 2011, there is no clear majority in favor of private ownership of farmland. While 37.8% of the interviewees supported the idea, 34.4% opposed it and 27.9% were unable to answer. Major reasons for this opposition were that “land should stay in state or municipal ownership” and that “land will be bought up by oligarchs and MPs.” This fear is shared by State Architectural and Construction Inspection Chief, Maksim Martynyuk, who depicts the social consequences as “catastrophic”, and expects farmers to lose...
their livelihoods if the moratorium is lifted at the beginning of 2016. To prevent this, and as a result of an assessment for monitoring the implementation of the Voluntary Guidelines on the Responsible Governance of Tenure of Land, Fisheries and Forests, it has been suggested that the moratorium be lifted “in a phased manner”. The introduction of a computerized land administration system aims to contribute to greater transparency and to lower the costs of land registration. However, due to the economic crisis and now the civil war in the country, the majority of Ukrainians have no money to purchase the relatively cheap land.

Although the elite governing the country tries to benefit as much as they can from Ukraine’s ‘Black Earth’, this important national resource has not yet been officially divided amongst oligarchs and international investors. In the past, there were protests against the attempts of president Viktor Yanukovych and his ‘family’ to secure this future business. It is now the turn of the current President, Petro Poroshenko, to feather his own nest within the agricultural sector. Poroshenko, also known as the ‘chocolate king’ is yet to sell his business, despite having promised to do so once elected as president. The acreage of his agro-holding, Agroprodinvest, tripled last year, and provides the sugar beet for his famous chocolate company Roshen. It is thus no coincidence that the agrarian committee is the most popular committee in the Ukrainian parliament, and new oligarchs are highly likely to emerge in the agricultural sector.

With the Government’s ‘Western turn’ there is a revival of the discourse on creating transparency, incentives for foreign direct investment and ensuring property rights for the agricultural sector. For instance, in 2014 a new initiative was launched with the EU Twinning program to provide examples of EU ‘best practices’ in order to support the liberalization of the land market. However, this ‘Western turn’ does not necessarily lead to a more democratic way of farming and governing resources. Instead it could open up the country for Western agribusiness investors from the EU and the US. This move from a national to a more Western capital-guided strategy had already been seen after the Orange Revolution in 2004.

The lack of support for small-scale producers by international financial institutions, such as the European Bank for Reconstruction and Development (EBRD), strongly indicates that national and international agribusinesses are favored in the country. The EBRD openly admits that, due to their system of loaning foreign currencies, financing small-scale producers is hardly possible. The EU Association Agreement also assists agribusiness to target Ukraine as a resource-rich country. The liberalization of the land market would be contrary to Article 48 of Ukraine’s Constitution, which stipulates that “[e]veryone has the right to a standard of living for himself or herself, and his or her family that includes adequate nutrition, clothing and housing.” These current developments undermine the right to adequate food and nutrition. Therefore, while the relationship between the national and international elite is changing, unless there are major modifications to the current power structures, land concentration will continue—to the detriment of the Ukrainian population.
